
Opus agents decide (shop, buyer) and interpret the market (curator); **code** trades at order speed and measures; **memory** is files reached through tools, the curator's digest and each strategist's scored episodes and lessons; **watchers** push to the user's phone and bring the user's messages back; **humans**: the user sets goals and big calls (chat or ntfy), the operator (Claude Code) turns them into code and notes.

Kit base form vs this: the kit runs one rule seller and one buyer per order. Here a code trading layer is steered through bounded knobs by two Opus strategists that diagnose before moving and are scored on their predictions (a miss reverts the move); a third Opus agent is the shared memory and market-intelligence hub; A/B arms are judged on score per order; and alerts plus a two-way phone channel tie the user and the operator into the loop.
